Folding Fractions (SG pp. 258–260)

Questions 1–11

- The denominator tells that the whole is divided into four equal pieces.
- The numerator tells that we are interested in three of the pieces.
- Richard showed four parts on his strip but they are not equal. He needs to show 4 equal parts to show fourths.
- The size of the parts gets smaller as the number of parts (denominator) gets bigger.
- $\frac{2}{4}, \frac{3}{6}, \frac{4}{8}$
- $\frac{6}{8}$
- $\frac{2}{6}$
- Peter, since $\frac{3}{4}$ is larger than $\frac{1}{2}$.
- Roberto, since $\frac{1}{2}$ is smaller than $\frac{5}{8}$.
- A. $\frac{1}{4}$ B. $\frac{1}{2}$
C. $\frac{4}{6}$ D. $\frac{7}{8}$
E. $\frac{2}{3}$
- A. $\frac{1}{8}, \frac{1}{4}, \frac{1}{2}$ B. $\frac{2}{4}, \frac{2}{3}, \frac{2}{2}$
C. $\frac{1}{8}, \frac{1}{6}, \frac{1}{3}$ D. $\frac{2}{6}, \frac{4}{8}, \frac{2}{3}$

Folding Fractions

Lee Yah demonstrated folding fourths for her class.

"First, I folded my strip into two equal pieces. Next, I kept it folded and then I folded it in half again. When I unfold the strip, it is divided into 4 equal pieces. Since the 4 parts are all the same size, each piece is $\frac{1}{4}$ of the strip."

She showed three of the pieces to show $\frac{3}{4}$ of the strip.

In a fraction, the bottom number is the **denominator**. This number tells us how many equal pieces the whole is divided into. The top number, the **numerator**, tells us how many of the pieces we are interested in.

$\frac{3}{4}$
 ← numerator
 ← denominator

- In the fraction $\frac{3}{4}$, what information does the denominator give us?
- What information does the numerator give us in the fraction $\frac{3}{4}$?
- Richard folded his strip and marked the fourths. Does his strip show fourths? How do you know?

- Look at your fraction strips. What happens to the size of the fractional parts as the denominator gets bigger?

Here is a chart made from fraction strips. The strips are in order from largest to smallest.

Fraction Chart

Whole							
$\frac{1}{2}$				$\frac{1}{2}$			
$\frac{1}{3}$		$\frac{1}{3}$		$\frac{1}{3}$		$\frac{1}{3}$	
$\frac{1}{4}$		$\frac{1}{4}$		$\frac{1}{4}$		$\frac{1}{4}$	
$\frac{1}{6}$		$\frac{1}{6}$		$\frac{1}{6}$		$\frac{1}{6}$	
$\frac{1}{8}$		$\frac{1}{8}$		$\frac{1}{8}$		$\frac{1}{8}$	

When two fractions show the same part of the whole, they are called **equivalent**. For example, $\frac{1}{2}$ and $\frac{2}{4}$ are equivalent to each other. Use the Fraction Chart to help answer these questions:

- Make a list of fractions that are equivalent to $\frac{1}{2}$.
- Find a fraction that is equivalent to $\frac{2}{3}$.
- Find a fraction that is equivalent to $\frac{1}{3}$.

Use the Fraction Chart to complete the following questions.

- Peter and his older brother each ordered a personal pizza for dinner. The pizzas were the same size. Peter ate $\frac{3}{4}$ of his pizza. His brother ate $\frac{1}{2}$ of his pizza. Who ate more pizza?
- Roberto walks $\frac{1}{4}$ of a mile to get to school. Keenya walks $\frac{5}{8}$ of a mile to get to school. Who lives closer to the school, Keenya or Roberto?
