

Multiplication Strategies

Solve the following problems:

- Decide whether you need an exact answer or an estimate.
- Then, decide whether it is more efficient to use mental math or paper-and-pencil. See the *Multiplication Strategies Menu* in the *Student Activity Book*.

Show all your work with paper and pencil. Be prepared to explain your mental math strategies.

- A sailboat can travel about 27 miles in 1 hour. How far can the sailboat travel in 6 hours?
- There are 25 crackers in a box. If 5 children each ate one box of crackers, how many crackers did the children eat altogether?
- Mr. Thomas drove for 3 hours without stopping. He drove about 55 miles every hour. About how far did he drive?
- The Rodriguez family is having a big party. Mrs. Rodriguez knows she should have 70 cans of soda. Ana buys 3 cases of soda. Each case contains 24 cans of soda. Will this be enough soda? Why or why not?
- There are about 22 students in each classroom at Smith School. There are 8 classrooms in the school. About how many students are in the school?
- The array below has 6 rows of 13 tiles. How many tiles are in the array?

□	□	□	□	□	□	□	□	□	□	□	□	□	□	□	□
□	□	□	□	□	□	□	□	□	□	□	□	□	□	□	□
□	□	□	□	□	□	□	□	□	□	□	□	□	□	□	□
□	□	□	□	□	□	□	□	□	□	□	□	□	□	□	□
□	□	□	□	□	□	□	□	□	□	□	□	□	□	□	□
□	□	□	□	□	□	□	□	□	□	□	□	□	□	□	□

- Maya's array has 7 rows of 50 tiles. Ming's array has 7 rows of 46 tiles. Whose array has more tiles? How do you know?

Multiplication Strategies SG • Grade 4 • Unit 4 • Lesson 10 161

Student Guide - Page 161

- An array has 9 rows of 58 tiles. How many tiles are in the array?
- An array has 5 rows of 86 tiles. How many tiles are in the array? Explain a way to do this problem in your head.
- Ana solved 99×7 .

I used simpler numbers. $99 + 1 = 100$
 So $100 \times 7 = 700$ and $1 \times 7 = 7$.
 Then I added, $700 + 7 = 707$.
 $99 \times 7 = 707$

Do you agree with Ana's solution? Tell Ana what you think of her solution.

- Choose one problem in Questions 1–8 that you solved using mental math and explain your thinking.

Use the *Multiplication Strategies Menu* and the *Practicing Multiplication Strategies* pages in your *Student Activity Book* for more 2-digit by 1-digit multiplication practice.

Multiplication Strategies

Questions 1–11 (SG pp. 161–162)

Strategies will vary.

- 180 miles; About $30 \text{ miles} \times 6 \text{ hours} = 180$ miles or about $25 \text{ miles} \times 6 \text{ hours} = 125$ miles
- 125 crackers; $25 \text{ crackers} \times 5 \text{ children} = 125$ crackers
- Between 150 and 180 miles;
 $50 \text{ miles} \times 3 \text{ hours} = 150$ miles;
 $60 \text{ miles} \times 3 \text{ hours} = 180$ miles.
- 72 cans;
 Yes, because $3 \text{ cases} \times 24 \text{ cans} = 72 \text{ cans}$
- About 160 students;
 $20 \text{ students} \times 8 \text{ classrooms} = 160$ students
- 78 tiles; $13 \text{ tiles} \times 6 \text{ rows} = 78$ tiles
- * Maya has more tiles because Ming has fewer tiles per row and therefore fewer tiles overall.
- 522 tiles; $9 \text{ rows} \times 58 \text{ tiles} = 522$ tiles
- 430 tiles; $5 \text{ rows} \times 86 \text{ tiles} = 430$ tiles; using a mental strategy: $5 \times 90 = 450$; $5 \times 4 = 20$; $450 - 20 = 430$
- * Anna should have subtracted rather than added. 99×7 should be less than 100×7 .
- Answers will vary.
