

Student Guide

Questions 1–6 (SG pp. 208–210)

1.\* Doubling Machine

Input	Output
25	50
7	14
14	28
15	30
100	200
50	100
2.5	5
$N$	$2 \times N$

2.\* Mystery Machine

Input	Output
10	20
20	30
5	15
17	27
35	45
25	35
0	10
29	39
$N$	$N + 10$

- It adds 10 to the input number.
- Subtract 10 from the output number.

- Irma and Luis tried the doubling machine on lots of numbers. They put their results in a table like the one below. Make a table like this one and fill in the blank spaces.

Doubling Machine

Input	Output
25	50
7	14
14	
	30
100	
	100
	5
$N$	$2 \times N$

Luis: Say, Irma, I found another machine over here, but I can't read the label.  
 Irma: Let's try it out and see if it works.  
 Luis: I put in 10 and out came 20.  
 Irma: It looks like another doubling machine. Let's put in 20.  
 Luis: 30 came out, so it can't be doubling.

Student Guide - Page 208

- Make a table like the one below, and fill in the missing entries.

Mystery Machine

Input	Output
10	20
20	30
5	15
17	27
	45
25	
0	
	39
$N$	

- What does the mystery machine do? There are many ways to answer this question. You can write the answer in words: The mystery machine is an "add ten machine."

You can write the answer in symbols. If we use  $N$  to stand for the input number, then:

$$N + 10 = \text{Output}$$

- If you are given an output number, how can you find the input number?

The doubling machine and the mystery machine that Irma and Luis found in the attic were similar: for every number that went into the machine, an output number came out. One machine followed the doubling rule and the other followed the "add 10" rule to get the output number.

In mathematics, a rule that gives an output for every input is called a **function**. The first machine used the doubling function. The second machine used the "add ten" function.

Student Guide - Page 209

\*Answers and/or discussion are included in the lesson.

5. Look at the function table below. The students in Mrs. Dewey's class are trying to find the rule.

Input	Output
1	3
2	6
5	15
6	18
10	30
$N$	

- A. Test each student's rule. Do you agree with Jackie, Ming, or Roberto? Why or why not?  
 B. Choose three input numbers, then find the three output numbers using the rule you found in Question 5A.

6. The students in Mrs. Dewey's class are trying to find the rule for the function table below.

Input	Output
2	5
3	6
5	8
10	13
$N$	

- A. Test each student's rule. Do you agree with Shannon or John? Why or why not?  
 B. Choose three input numbers, then find the three output numbers using the rule you found in Question 6A.

Use the *Function Tables* pages in your *Student Activity Book* to practice working with functions.

5. A.\* I agree with Roberto because if you multiply every input number by 3 you get the output number.  
 B.\* Answers will vary.
6. A. I agree with John because when I tried Shannon's rule with 2, then  $2 \times 2$  did not equal 5. But, John's rule worked for all the input numbers.  
 B. Answers will vary.
