Julia solved $\frac{3}{10} + \frac{4}{5}$ this way:

$$\frac{4 \times 2}{5 \times 2} = \frac{8}{10}$$

$$\frac{3}{10} + \frac{8}{10} = \frac{11}{10} = 1\frac{11}{10}$$

If I can rename $\frac{4}{5}$ as tenths, they will be easier to add.

Julia

5. Solve Question 1 Julia's way. Find equivalent fractions with common denominators.

$$\frac{2}{3} + \frac{1}{2}$$

$$\frac{2 \times \square}{3 \times \square} = \frac{\square}{6} \qquad \frac{1 \times \square}{2 \times \square} = \frac{\square}{6}$$

$$\frac{\square}{6} + \frac{\square}{6} = \underline{\quad} = \underline{\quad}$$

6. Use Julia's way to solve the problems.

A. $\frac{1}{2} + \frac{7}{8} = ?$ Number sentence _____

B. $\frac{5}{6} + \frac{2}{3} = ?$ Number sentence _____

C. $\frac{3}{4} + \frac{10}{12} = ?$ Number sentence _____
